Human lymphocyte cell surface glycoprotein (HuLHR) variant
                                  01-NOV-1996
                                                             AAR98126;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antivirial, neuromodulating and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             22-NOV-1989;

Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant is an Asn136 deletion mutant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        22-NOV-1989;

                                                                                                                                                       immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                              A hybrid immunoglobulin chain comprising the ligand binding site a single transmembrane receptor without an active transmembrane
                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid encoding hybrid immunoglobulin comprising the ligand binding site of a receptor fused to Ig constant region - useful for diagnosis and treatment e.g. of inflammation
                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A hybrid immunoglobulin chain comprising the ligand binding site of a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or constants of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant is a Ser166 deletion mutant.

                                                                         AAR98110 standard; Protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              22-NOV-1989;

immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin constant region. The adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in control of LBP and their targets; or therapeutically to deliver vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region improved the province of the transmembrane region improved the province of the transmembrane region in the province of the province of the transmembrane region in the province of the transmembrane region in the province of the province 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              22-NOV-1989;

CC a single transmembrane receptor without an active transmembrane concerns to the constant region. The N-terminus of an continuous of the N-terminus of an continuous of the continuous of the immunoglobulin constant region. The receptor is not a member of the continuous of the continuous of the continuous of the continuous of the immunoglobulin chain combines continuous of the provided the adhesion/targetting of a ligand binding partner (LBP) with the continuous of immunoglobulin and can bind to and/or activate continuous of the partner transmembrane recurs to continuous of the partner transmembrane continuous of the partner transmembrane tells.

CC Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in continuous of the process of the immunoglobulin component increases plasma half life and continuous partners continuous of the immunoglobulin component increases plasma half life and continuous partners purification while deletion of the transmembrane region contentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an Lys78Gin substitution.

The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery improves anneous solubility and removes

the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16-DEC-1991;

The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver the purchase account of the control of 
                                                                                                                                                                                            Key

                                                                                                                                                                                                                                                                                                                                                           Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitcopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immunoglobulin super family nor a multiple subunit polypeptide encoded by discrete genes. The hydrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver vitro assay of LBP and to act to the superficiency and the superficiency to deliver the such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A hybrid immunoglobulin chain comprising the ligand binding sit a single transmembrane receptor without an active transmembrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid encoding hybrid immunoglobulin comprising the ligand binding site of a receptor fused to Ig constant region - useful for diagnosis and treatment e.g. of inflammation

                                                                                        immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                      Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. treating graft rejection; inflammation; metastasis of lymphoma et The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane regificallitates.
                                                                                                                                                                                                       A hybrid immunoglobulin chain comprising the ligand binding site a single transmembrane receptor without an active transmembrane a single transmembrane receptor, fused at its C-terminus with the N-terminus of an

                 The gene product may be used as a ligand binding partner in combination with a stable plasma protein eg. IgGl-IgG4, IgA, IgE, IgD or IgM. The fusion product is joined by N- or C-terminal groups, preferably the N-terminal of the Fc region of the spp is linked to the C-terminal of lbp. They may be used to provide antiviral, immunomodulatory and neuromodulatory treatment as well as in treatment of receptor
                                                                                                                                                                    WPI;

Full length cDNA clones and DNA encoding the human and the murine LHR (HuLHR and MLHR, respectively) have been identified and isolated (see AAQ24987 and AAQ24988). LHR is a glycoprotein which contains the following protein domains: a signal sequence, a carbohydrate binding domain, and epidermal growth factor-like (egf) domain, at least one and preferably two complement binding domain repeat, a transmembrane binding domain (TMD), and a charged intracellular or cytoplasmic domain. LHR is used as the ligand-binding partner in fusion polypeptides with an immunoglobulin,

                                                                                                                                                                                                                                                                                                                                      A human peripheral blood lymphocyte cDNA library in lambda gt10 was screened with a 2.2kb EcoRI insert of the murine Mel14 antigen clone (i.e. a murine LHR sequence). The largest EcoRI insert (2.2kb) was isolated and sequenced. The ORF codes for 372 amino acids with a mol. wt. of approximately 42.200. Comparison of the HuLHR amino acid sequence with the murine LHR sequence (AAR37951) showed a high degree of amino acid conservation in each of the LHR domains, e.g. 96% in the transmembrane domain and 83% in the carbohydrate binding of lymphocytes to lymphoid tissue to treat inflammation or graft rejection. They could also be used to control lymphoma metastasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human and murine lymphocyte homing receptors to treat graft rejection and inflammation - comprise carbohydrate binding, epidermal growth factor and complement binding domains

                                                      The sequences given in AAR38908-09 represent human and murine lymphocyte cell surface glycoprotein (LHR) respectively. These proteins mediate the binding of lymphocytes to the endothelium of lymphoid tissue. LHR is a glycoprotein which contains a signal domain, a carbohydrate binding domain, an epidermal growth factor-like (egf) domain, at least one complement binding domain repeat, a transmembrane binding domain (YMD) and a charged intracellular or cytoplasmic domain. The murine and human amino acid sequences show a high degree of overall homology (83%), however degrees of homology between the various domains is variable. These proteins may be fused to a ligand binding partner protein (LBPP) which causes an increase in the half life of the LHR. The fusions may be used therapeutically to compete with the normal binding of lymphocytes to lymphoid tissue. They may be used in organ or graft rejection and for the treatment of inflammation.
                                                                                                                                                                                                                                                                                                                                23-FEB-1989;

                                                                                                                                                                                                                                                                                                      A mouse LHR (lymphocyte cell surface glycoprotein) cDNA clone was used to screen an oligo-dT primed lambda gt10 cDNA library derived from human peripheral blood lymphocyte mRNA obtd. from primary cells. A 2.2 kb clone (sequence given in AATOS869) was isolated that encoded the human LHR protein (AAR83050). LHR-IgG hybrids were constructed for use in the targeting of therapeutic moieties to lymphoid tissue.

                                                                                                                         immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery immoves
                                                                                                                                                                                                                                                                                                                                                                  a single
                                                                                                                                                                                                                                                                                                                                                                                    A hybrid

This sequence is the human lymphocyte homing receptor (LHR) of the CC invention. LHR is a lymphocyte cell-surface glycoprotein that mediates CC the binding of lymphocytes to the endothelium of lymphoid tissue. Soluble CC LHR polypeptides, lacking signal peptide (amino acids 1-38), acids 356-372), can be used therapeutically to compete with the normal CC organ or graft rejection treatment protocols, for treating inflammations CC such as arthritis and other autoimmune diseases, for control of lymphoma CC interesting the autoimmune diseases, for control of lymphoma CC interesting conditions involving lymphocyte accumulation. CC orcompetitive inhibitors of LHR activity, and for purifying anti-LHR antibodies or antibodies, and as immunogens for raising anti-LHR antibodies.

The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A hybrid immunoglobulin chain comprising the ligand binding sit a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an
                                                                 AAR98132 standard;
                                                                                                                                                                                                                                                                                                                                                                                                   facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a 67-Glu-Ser-Ala insertion

```
immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are glven in AAR98105. This variant contains a 83-Gly-Thr-Thr insertion.

The receptor is not a member of the cenceded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the ceffector functions of immunoglobulin and can bind to and/or activate concern than one ligand. It can be used diagnostically for the in combines concern than one ligand. It can be used diagnostically to deliver control assay of LBP and their targets; or therapeutically to deliver constant applications are as antiviral, neuromodulating and control assay of the control as antiviral, neuromodulating and control applications are as antiviral, neuromodulating and control immunomodulating agents, or as modulators of cell adhesion (e.g. in control control component increases plasma half life and control contro

Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an Ile288Val substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        316 qkldksfsmike
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A hybrid immunoglobulin chain comprising the ligand binding site of a single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an incomprising the ligand binding site of region; fused at its C-terminus with the N-terminus of an incomprising the ligand binding site of the site of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Local Similarity

                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                        δÃ
                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                      immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains an Ile302Leu substitution.

                        Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc. The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a Ser226Thr substitution.
                                                                                                                                                           immunoglobulin super family nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid encoding hybrid immunoglobulin comprising binding site of a receptor fused to Ig constant region diagnosis and treatment e.g. of inflammation
                                                                                                                                                                                                                                                                  region; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a men

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc immunoglobulin super family, nor a multiple subunit polypeptide
cc encoded by discrete genes. The hybrid immunoglobulin chain combines
cc effector functions of immunoglobulin and can bind to and/or activate
cc effector functions of immunoglobulin and can bind to and/or activate
cc effector functions of immunoglobulin and can bind to and/or activate
cc vitro assay of LBP and their targets; or therapeutically for the in
cc LBP such as toxins, enzymes growth factors to particular cells.
cr Typical applications are as antiviral, neuromodulating and
creating graft rejection; inflammation; metastasis of lymphoma etc.)
cr The immunoglobulin component increases plasma half life and
cf facilitates purification while deletion of the transmembrane region
contentially immunogenic epitopes. Variants of the human lymphocyte
cell surface glycoprotein described in AAR98106 are diven in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches 131;

                                                                                                                                                                                                                                                                                                                                                                                                                       encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation, metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23-FEB-1989;

                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                   facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a Thr282Ser substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure; Page 19; 41pp; English.

The protein sequence was deduced from the DNA sequence obtd. by screening an oligo dT primed lambda gt10 cDNA library derived from human peripheral blood lymphocyte mRNA obtd. from primary cells, with a 2.2 kb EcoRI insert of the murine Mel 14 antigen cDNA clone. The protein contains regions encoding a carbohydrate binding domain, an EGF-like domain, a complement binding domain and a transmembrane domain. The protein contains 26 cystein residues. Cells transformed by the hLHR DNA are used to produce LHR (which mediates binding of lymphocytes to the endothelium of lymphold tissue). LHR or its variants are useful as reagents for assaying LHR or anti-LHR anti-bodies, to purify the antibodies, as immunogens, and therapeutically to compete with normal binding of lymphocytes (to prevent graft/organ rejection; to treat inflammation (such as rheumatod arthritis or
                                     other autoimmune diseases); for control of lymphocyte metastasis, and to treat conditions associated with accumulation of lymphocytes). Derivs. and variants of LHR may be produced having modified properties, e.g. increased activity, longer plasma half-life, reduced side effects and better aq. solubility.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A hybrid immunoglobulin chain comprising the ligand binding site of a single transmembrane receptor without an active transmembrane as a single transmembrane receptor without an active transmembrane creation; fused at its C-terminus with the N-terminus of an immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide cencoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the creation of limmunoglobulin and can bind to and/or activate center than one ligand. It can be used diagnostically for the in creation of LBP such as toxins, enzymes, growth factors to particular cells. The such as toxins, enzymes, growth factors to particular cells. Immunomodulating agents, or as modulators of cell adhesion (e.g. in creating graft rejection; inflammation; metastasis of lymphoma etc.) and creating graft rejection; inflammation; metastasis of lymphoma etc.) and creatilitates purification while deletion of the transmembrane region cellitates recovery, improves aqueous solubility and removes cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a Phe214Leu substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                     Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a Phe244Met substitution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunoglobulin super family nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid encoding hybrid immunoglobulin comprising binding site of a receptor fused to Ig constant region diagnosis and treatment e.g. of inflammation

Nucleic acid encoding hybrid immunoglobulin comprising binding site of a receptor fused to Ig constant region diagnosis and treatment e.g. of inflammation the ligand - useful for

Disclosure; Page 19; 41pp; English.

immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are glven in AAR98109-R98135. This variant contains a Lys298-Lys299; Arg-Arg A hybrid immunoglobulin chain comprising the ligand binding situating situations as single transmembrane receptor without an active transmembrane region; fused at its C-terminus with the N-terminus of an site of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR98106 are given in AAR98109-R98135. This variant contains a 209-Asn insertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells.

                                                                                                                                                                                                                                                                          immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targettling of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region facilitates recovery, improves aqueous solubility and removes potentially immunogenic epitopes. Variants of the human lymphocyte cell surface glycoprotein described in AAR88106 are given in
                                                                                                                                                                                                           Query Match

                                                                                                                                                                                 A hybrid
a single
          immunoglobulin constant region. The receptor is not a member of the immunoglobulin super family, nor a multiple subunit polypeptide encoded by discrete genes. The hybrid immunoglobulin chain combines the adhesion/targetting of a ligand binding partner (LBP) with the effector functions of immunoglobulin and can bind to and/or activate more than one ligand. It can be used diagnostically for the in vitro assay of LBP and their targets; or therapeutically to deliver LBP such as toxins, enzymes, growth factors to particular cells. Typical applications are as antiviral, neuromodulating and immunomodulating agents, or as modulators of cell adhesion (e.g. in treating graft rejection; inflammation; metastasis of lymphoma etc.) The immunoglobulin component increases plasma half life and facilitates purification while deletion of the transmembrane region
                                                                                                                                                                                                                                           Nucleic acid encoding hybrid immunoglobulin comprising binding site of a receptor fused to Ig constant region diagnosis and treatment e.g. of inflammation
                                                                                                                                                                                                                                                                                                                                            (GETH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2 cDNA clones encoding Leu8 determinants (AAR91442 and AAR91443) were isolated from a human T-cell library using a novel immunoselection cloning method. The longer insert (AAR14723) contained 2,350 residues, while the shorter lacked 436 internal residues. A major transcript of 2.4 kb was present in peripheral blood mononuclear cells (PBMC), tonsillar B cells, and several lymphocytic cell lines, and a minor transcript of 2.0 kb in PBMC, Jurkat and HSB-2 leukaemic T-cell lines. Leu8 antigens can be obtd. for diagnostic and therapeutic use. The presence or absence of Leu8 on CD4+ T-cell subsets. Soluble forms of Leu8 can act as antiinflammatory agents by reducing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Leu8- T-cells to antigen presenting cells, or the ability to cause such binding to occur on surfaces other than lymphocyte cells, can be useful in diagnostics and therapy. The level of activated Leu8-T-cells relative to resting Leu8+ cells could serve as a measure of immune response to a particular antigen. Modification of the specificity of the extracellular domain of Leu8, which mediates adhesion to specific endothelial cells of lymph nodes, could serve to regulate the homing potential of resting T cells. Soluble forms of Leu8 could act as antiinflammatory agents by reducing lymphocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antigen is given in AAY96138. The method, designed to isolate cell surface antigen (CSA) cDNAs, is based upon transient expression of a CSA in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to (panning on) an antibody-coated substrate such as a culture dish. CSA nucleic acids isolated by the method of the invention, and the proteins they encode, are useful for immunodiagnostic and immunotherapeutic applications, including the disonosis and treatment of immune-mediated infections, diseases, and disorders in animals, including humans. These disorders include asthmatic applications in the contraction of the contractio
                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         multiple sclerosis.

human T cell library using the rapid immunoselection cloning method (see e.g. AAQ21164 for description of method). This protein sequence was deduced from the larger insert. The hydrophobic putative membrane-spanning domain is followed by several positively charged residues resembling a cytoplasmic anchor sequence. The protein is closely related to the murine Mel-14 homing receptor. See AAQ22500 for the shorter insert and AAR22551 for the phospholinia anchored form of Leu8 antigen.
